Acute Spinal Cord Injury (Quadriplegia/Paraplegia) Therapy Guideline

Goals for the care of a Spinal Cord Injury (SCI) patient:
1. Level of spinal cord injury is confirmed and communicated to entire healthcare team
2. The patient will remain free from secondary infections [ventilator-associated pneumonia (VAP) or respiratory infection, bloodstream infection (BSI), and or catheter-associated urinary tract infection (CAUTI)].
3. The patient will not develop pressure ulcers
4. Promote an environment of safety (adequate method to communicate needs, adaptive call system for nurse, and interventions to prevent falls)
5. Patient and family will receive education regarding injury and plan of care

</tbody>
</table>
### Respiratory System (continued)

**Phase 1 Critical Care Unit (NSICU, TICU, MSICU)**

**Standard Respiratory Care for all NON-VENTILATED SCI Patients WITHOUT evidence of respiratory compromise/disease:**
- Monitor for need for mechanical ventilation (respiratory failure, intractable atelectasis on CXR, etc)
- EZ-PAP Q4H
- Cough Assist Device Q4H
- Peridex oral rinse 15mL swish & spit/suction QID PC/HS
- Albuterol 2.5mg/3mL nebulized Q4H prn increased secretions

**NON-VENTILATED SCI Patients “aggressive protocol” WITH history of smoking/respiratory disease OR increased secretions / change in pulmonary function:**
- Assess for need for NT suctioning
- Discontinue EZ-PAP
- Metaneb Q4H
- Cough Assist Device Q4H
- Peridex oral rinse 15mL swish & spit/suction QID PC/HS
- Salmeterol (Serevent®) 50mcg inhaled Q12H
- Albuterol 2.5mg/3mL nebulized Q4H
- Abdominal binder when OOB to chair

**Thick Secretions**
- Add heated humidification to ventilator circuit
- Mucomyst 10% 3mL nebulized Q4H or Q6H
- Consider bronchoscopy/BAL

---

**Phase 2 De-escalation of Therapy (TSDU, Neuro 8A/C)**

**Standard Respiratory Care for all NON-VENTILATED SCI Patients WITHOUT evidence of respiratory compromise/disease:**
- Discontinue Peridex when patient tolerating PO diet
- Continue current care
- Discontinue albuterol if not needed for > 72 hours

**NON-VENTILATED SCI Patients on “aggressive protocol”**
- Discontinue Peridex when patient tolerating PO diet
- Assess for need for NT suctioning
- Continue current care
- When improved mechanics, switch Metaneb to EZ-PAP
- If minimal to no secretions, change albuterol to PRN

**Thick Secretions**
- Continue current therapy
- Discontinue Mucomyst when secretions become thin
### Acute Spinal Cord Injury (Quadriplegia/Paraplegia) Therapy Guideline

<table>
<thead>
<tr>
<th>Phase 1</th>
<th>Critical Care Unit (NSICU, TICU, MSICU)</th>
<th>Phase 2</th>
<th>De-escalation of Therapy (TSDU, Neuro 8A/C)</th>
</tr>
</thead>
</table>
| **Cardiac Goals:** | - Restore normal hemodynamic parameters  
- Goal MAP > 70  
- Goal HR > 60 | **Monitoring Parameters** | **Monitoring Parameters** |
| **Monitoring Parameters** | - Bradycardia (HR < 60)  
- Hypotension (MAP < 70) | **Hypotension** | - Same as Phase 1  
- Assess for signs and symptoms of Autonomic Dysreflexia (wrinkles, bowel, and bladder) |
| **Hypotension** | - NS 2L IV – only for trauma bay resuscitation  
- Norepinephrine 0.05mcg/kg/min – titrate to keep MAP >70  
- Apply Ted hose and ACE wraps to BLE prior to assisting OOB to chair – remove when back to bed  
- SCDs while in bed | **Hypotension** | - Norepinephrine must be off prior to transfer from ICU  
- Midodrine 5mg po TID (0800/1200/1600)  
- Alternative therapies for persistent hypotension:  
  - Sodium chloride (NaCl) tabs to maintain serum Na 140-145 mEq/L  
  - Fludrocortisone (Florinef) 0.1mg PO/PT Q12H (may increase dose and frequency)  
- Apply Ted Hose and ACE wraps to BLE prior to assisting OOB to chair – remove when back in bed  
- SCDs while in bed  
- If not responding to Robinul or an adverse event to Robinul, may consider:  
  - Caffeine 200mg PO/PT Q12H x 3 days  
  - Consider permanent pacemaker for persistent bradycardia or frequent asystole |
| **Bradycardia** | - Assess need for respiratory suctioning frequently to avoid mucus plugs  
- Ambu-bag with FiO₂ 1.0  
- Atropine 0.5mg IV Q1H PRN HR < 40  
- Norepinephrine 0.05mcg/kg/min – titrate to keep MAP>70  
  If develops symptoms of bradycardia, consider starting:  
  - Robinul 0.1-0.2mg IV Q8H to Q12H  
  (or Robinul 1-2mg PO/PT Q8H to Q12H)  
  - OR External pacing or temporary pacemaker for persistent bradycardia to maintain HR > 60 | **Bradycardia** | - Continue aggressive pulmonary toilet  
- Robinul 0.1-0.2mg IV Q8H to Q12H  
(or Robinul 1-2mg PO/PT Q8H to Q12H)  
- If not responding to Robinul or an adverse event to Robinul, may consider:  
  - Caffeine 200mg PO/PT Q12H x 3 days  
  - Consider permanent pacemaker for persistent bradycardia or frequent asystole |
### Acute Spinal Cord Injury (Quadriplegia/Paraplegia) Therapy Guideline

<table>
<thead>
<tr>
<th>Gastrointestinal Goals:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Normal gastric emptying</td>
</tr>
<tr>
<td>• Tolerate enteral (gastric) or oral feeding</td>
</tr>
<tr>
<td>• Scheduled BM</td>
</tr>
<tr>
<td>• Minimal diarrhea / constipation</td>
</tr>
</tbody>
</table>

**Phase 1**

**Critical Care Unit (NSICU, TICU, MSICU)**

**Monitoring Parameters:**
- If NG/PEG: check residuals Q4H – Goal < 250mL
- Monitor for s/sx N/V
- Goal 1 BM daily – document on nursing flowsheet

**Stress Ulcer Prophylaxis:**
- Pepcid 20mg IV/PT/PO Q12H

**Gastric Emptying / Tube Feeding Intolerance (residuals >250mL/4h):**
- If PEG/NG feeding – change to post-pyloric DHT (placed into the duodenum)
- If persistant high residuals, add a prokinetic agent (e.g. metoclopramide, erythromycin, etc)

**Bowel Regimen – Prevent/Treat Constipation:**
- Per Tube: Senna 10mL PT Q12H
- Docusate Sodium (Colace) 100mg PT Q12H
- PO: Senna-S 2 PO Q12H
- Bisacodyl 10mg PR Daily (2000) with digital stimulation – only discontinue if excessive diarrhea

*If No BM by 72 hours after admission:*
- Sorbitol 30mL PO/PT Q12H until 1st BM
- Increase Bisacodyl (Dulcolax) to Q12H
- Miralax 17g PO/PT daily

**Diarrhea (liquid >500mL q8h and/or >3 stools/day for 2 days):**
- Hold bowel regimen
- Metamucil 1pkt PO/PT Q12H

**Phase 2**

**De-escalation of Therapy (TSDU, Neuro 8A/C)**

**Monitoring Parameters:**
- Same as Phase 1

**Stress Ulcer Prophylaxis:**
- Continue as long as the patient remains on the ventilator
- Discontinue when the patient is off the ventilator and tolerating tube feeds at goal or regular diet x 48 hours

**Gastric Emptying / Tube Feeding Intolerance (residuals >250mL/4h):**
- Continue to monitor residuals
- Discontinue prokinetic agent when the patient is at goal tube feed rate x 48 hours with residuals < 250 mL/4h

**Bowel Regimen – Prevent/Treat Constipation:**
- If no diarrhea and having daily BM, continue current regimen
- Switch to PO regimen if patient transitions from tube feeds to oral diet
- Follow Phase 1 recommendations for constipation

**Diarrhea (liquid >500mL q8h and/or >3 stools/day for 2 days):**
- Same as Phase 1
- Resume Docusate Sodium (Colace) & Bisacodyl (Dulcolax) 1st – then add Senna if constipation becoming an issue

Review OH Bowel Training Flow Chart (next page)
Acute Spinal Cord Injury (Quadriplegia/Paraplegia) Therapy Guideline

Nursing Bowel Training Flow Chart

Follow Non Neurogenic Bowel Program with client’s usual bowel routine & document

Patient Admitted

Neurogenic Bowel

Manual evacuation & digital stim for 20 min to assure that no stool is in the lower colon

Check for bulbocavernosus reflex

Check rectal sensation

Partial sensation

Full sensation

Dulcolax suppository
Allow 1-2 hours for results

No sensation

Dulcolax suppository using xylcaine 2% jelly, Allow 1-2 hours for results

Digital stim & manual evacuate for a minimum of 20 min or until lower bowel empties

Digital stim & manual evacuate using xylcaine 2% jelly for a minimum of 20 min or until lower bowel empties

If no results retry 2-3 times before trying new medication

Document Results

If no results retry 2-3 times before trying new medication

Document Results

Magic Bullet with KY jelly. Allow 1-2 hours for results

If no results notify MD & document

Check for stool manually evacuate if indicated

*Enemeez mini enema

Document Results

Check for stool & manually evacuate if indicated

If no results notify MD & document

Check for stool & manually evacuate if indicated

If no results notify MD & document

*Enemeez mini enema

Document Results

Check for stool & manually evacuate if indicated

If no results notify MD & document

Document Results

Check for stool & manually evacuate if indicated

If no results notify MD & document

Document Results

Note: digital stimulation is performed by inserting index finger to the first bend in client’s rectum and rotating finger in clockwise motion

Manual evacuation = using index finger, remove stool from the lower bowel

Document the stool amount, the consistency and odor and the amount of assistance given by the patient

No patient especially spinal cord patients should be allowed to have unsuccessful bowel programs for more than 48-72 hours. If they do not have autonomic dysreflexia, which is very likely to occur, use 3 Dulcolax tablets or magnesium citrate to clean them out immediately

All documentation should be in sunshine on the bowel program and assessment flow sheet or on the bowel program training form and daily flow sheet

If a patient is having accidents, the bowel program is not effective. Discuss with MD.

After an accident have patient return to room to stimulate and empty bowel.

Try all suppositories for 2-3 programs before changing to another

If patient experiencing pain and/or dysreflexia with bowel program, use Enemeez Plus mini enema which includes an analgesic

<thead>
<tr>
<th>Phase 1</th>
<th>Critical Care Unit (NSICU, TICU, MSICU)</th>
<th>Phase 2</th>
<th>De-escalation of Therapy (TSDU, Neuro 8A/C)</th>
</tr>
</thead>
</table>
| **Skin Care/Prevention** | • Cervical Collar  
  o Remove EMS collar  
  o Place Aspen Vista cervical collar or as ordered per neurosurgery  
  o Cervical collar care per Orlando Health standard  
  • Consult Wound Management  
  • Initiate the Pressure Ulcer Prevention Order Set  
  o Minimal sheets under patient  
  o Moisturize dry skin q12h  
  o Moisture barrier q12h  
  o Turn q2h while in bed using foam wedge for lateral positioning  
  o Weight shift/reposition q15-30min while up in chair  
  o Assess skin qshift and prn  
  • Place on low air loss mattress/pressure redistribution after spine stabilization and neurosurgical clearance  
  • Place Mepilex Sacral Silicon Dressing to coccyx/sacrum – reassess Q-shift and change Q-3-5 days. | | • Continue current skin care measures  
  • Cervical collar care per Orlando Health standard  
  • Low air loss/pressure redistribution mattress or as determined by the interdisciplinary team for function and prevention |
| **PT/OT/ST Rehabilitation & Mobility Plan** | • Consult PT/OT/ST  
  • Obtain proper environmental controls.  
  • Post Education sheets in room.  
  • Apply Prevalon boots to bilateral lower extremities – remove Q-shift and moisturize skin  
  • Out of bed to wheelchair (W/C) Q24H managing physicians & neurosurgery approves as patient tolerates  
  o Roho cushion at all times in chair when OOB  
  o Pressure relief protocol when pt in W/C (recline fully every 30 min for 60 sec and return to full upright).  
  • Passy Muir Valve (PMV) trials as soon as pt can tolerate even short periods of wear.  
  • Participate in family meetings.  
  • Chest PT when pt sitting on edge of bed. | | • PT/OT to assess need for orthotics for UE/LE  
  • Respiratory & ST to assess need for in-line PMV |

### Skin Care/Prevention Goals:
- Place appropriate cervical collar
- Prevent pressure ulcers

### PT/OT/ST Rehabilitation & Mobility Plan Goals:
- Increase functional ability
- Minimize contractures, etc.
### Acute Spinal Cord Injury (Quadriplegia/Paraplegia) Therapy Guideline

<table>
<thead>
<tr>
<th>Phase 1</th>
<th>Critical Care Unit (NSICU, TICU, MSICU)</th>
<th>Phase 2</th>
<th>De-escalation of Therapy (TSDU, Neuro 8A/C)</th>
</tr>
</thead>
</table>
| **VTE Prevention** | • SCD’s to bilateral lower extremities  
• Lovenox 30mg SQ Q12H – start ASAP if no surgical fixation or 72 hours after spinal stabilization surgery  
• *Alternative*: Heparin 5000units SQ Q8H (poor renal function)  
• Consider permanent IVC filter placement, especially if delay in starting chemical prophylaxis – no quad coughing for 3 days after placement | • Continue SCDs while in bed  
• Continue Lovenox – minimum 6 weeks of therapy  
• Consider permanent IVC filter placement if not placed in ICU |
| **Psychosocial** | • Consult Family and Patient Counseling  
• Consult Chaplain  
• Provide patient & family with a packet on SCI education, communication, and steps of grief | • Complete a baseline assessment of coping skills/adjustment to injuries  
• Show *Understanding Spinal Cord Injury* video  
• Child life for patient (if <18) or family (if siblings)  
• Pet Therapy  
• Volunteer Services for distraction  
• Adaptive equipment  
• Promote rest between MN and 0600 |
| **Goal:** | Prevent VTE  | **Goal(s):** | Foster effective coping strategies  
Provide SCI education to patient & family |
## Pain/Spasticity Treatment

### Goals:
- Attain adequate pain control
- Minimize side effects associated with analgesic agents
- Decrease post-SCI spasticity
- Improve participation with PT/OT/ST/ADL

### Phase 1 Critical Care Unit (NSICU, TICU, MSICU)

<table>
<thead>
<tr>
<th>Monitoring Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pain score via visual/analogue scale</td>
</tr>
<tr>
<td>SAS score (goal 4)</td>
</tr>
<tr>
<td>Spasticity – compliance with PT/OT</td>
</tr>
</tbody>
</table>

### Pain

#### Neuropathic Pain
- Gabapentin 100mg PO/PT q8 x 24h, then 200mg PO/PT q8 x 24h, then 300mg PO/PT q8; may increase to max 2400mg/d over 2-3 weeks
  - OR
  - Pregabalin 75mg po q12h, may increase to max 300mg po q12h over 1-2 weeks (adjust for renal dysfunction)

**Consider the following if also treating depression:**
- Amitriptyline 25mg po qhs, may increase to max 100mg over 1 week

#### Generalized Pain

**Mild pain:**
- Acetaminophen 650mg PO/PR Q6H prn pain
- Ibuprofen 800mg PO/PT Q6H prn pain (clear with neurosurgery first)

**Moderate pain:**
- Tramadol 50mg PO/PT Q4H prn pain

**Severe pain:**
- Enteral: Oxycodone 5-10mg PT Q4H prn pain
- PO: Percocet 5/325mg 1-2 PO Q4H prn pain

### Spasticity
- Baclofen 10mg PO TID (while awake) – max 120mg/day
- 2nd line: Tizanidine 2mg PO Q6H – max 36mg/day

### Phase 2 De-escalation of Therapy (TSDU, Neuro 8A/C)

<table>
<thead>
<tr>
<th>Monitoring Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Same as Phase 1</td>
</tr>
</tbody>
</table>

### Pain

#### Neuropathic Pain
- Continue to titrate medication as needed to specified maximum doses; if symptoms improve, consider weaning
- Both gabapentin or pregabalin should be weaned off over 1-2 weeks before discontinuing

### Generalized Pain
- If severe, intractable pain, may increase opioid dose – the goal, however, is to achieve control with lowest possible dose
- Continue current therapy with the goal to wean or discontinue opioids and/or benzodiazepines as quickly as possible to minimize respiratory & GI side effects
- De-escalate patients (EX: from Percocet → tramadol) as soon as possible

### Spasticity
- Monitor response to therapy (flexibility, ability to participate in PT/OT)
- Initiate or titrate therapy as appropriate per Phase 1 recommendations
  - If no response to baclofen or limited response to tizanidine:
    - Dantrolene 25mg PO Q24H – may titrate every 7 days to a max of 400mg/day
### Acute Spinal Cord Injury (Quadriplegia/Paraplegia) Therapy Guideline
